

Module 7 : Reports and Dashboards

At the end of this course, you will be able to:

- Understand Reports, Dashboards and Report Types
- Select a Report Type, Types of Filters
- Understand Tabular, Summary, Matrix and Joined Reports
- Understand Dashboard Builder
- Explore the steps to create a Custom Report Type
- Understand With or Without

What is a Report?

Reports in Salesforce are collections of data from the organization's records. These are used to analyze data, track performance, and make decisions based on the analysis.

What is a Dashboard?

A dashboard is a visual representation of data, generally created from the reports to analyze, monitor and track the performance of various indicators relevant to organization's objectives.

Use Report Builder

Building Blocks of a Report

1. **Report Type:** A report type in Salesforce defines the set of records and fields available to a report. It determines which fields from objects are included in the report. These are templates for creating reports.

There are two types of Report Types in Salesforce:

1. **Standard Report Type :** These report types are pre-defined by Salesforce which typically provide basic reporting capabilities of the standard and custom Objects.
2. **Custom Report Type :** Custom report types allow administrators to define new report types based on specific combinations of related objects and fields. Users can create the report type according to their requirements.

Reports: It is created from the organization's data used for analysis and taking decisions based on that data.

Building Blocks of a report:

1. Report type : This is the first thing that we select while creating a report. it defines the structure of the report.

2. Report format
3. Fields
4. Filters
5. Groupings
6. Scheduling the report

1. Report type : This is the first thing that we select while creating a report. it defines the structure of the report.

I am selecting the report type as 'positions' means we can have position object fields in our report.

I am selecting the report type as 'Positions with Candidates' means we can have position and candidate object fields in our report.

It can be of 2 types:

1. Standard report type: given by salesforce.
2. Custom report type: created by users.

2. Report format : WE have 4 report formats.

- > Tabular
- > Summary
- > Matrix
- > Joined

Report Formats

What is a Report Folder ?

Report folders are storage locations for storing the reports. They are important for organizing and managing reports.

By default, we have two broad categories of Report Folders:

1. **Private Reports:** Reports, in this folder, are only accessible to the user who created them.
2. **Public Reports:** Reports, in this folder, are accessible to all the users.

2. Report format : WE have 4 report formats.

--> Tabular: it is in the form of rows and columns. we can have filters in this report. WE cannot create charts on this.

--> Summary: we can group the data based on some field. WE can create charts in this report.

Report Formats

Sharing a Report Folder

Different Access Levels of sharing a Report Folder:

- 1. View:** Users can see the folder and reports it contains.
- 2. Edit:** Users can modify the reports within the folder.
- 3. Manage:** Users get full control over the folder i.e. Users can move, rename, share or delete the folder. Users can also add or remove reports from the folder.

Share folder

These sharing settings apply to all subfolders in this folder.

Building Blocks of a Report

2. Report Formats: It refers to the layout or structure in which the report data is presented. There are four report formats in Salesforce:

Report Format	Definition
Tabular Report	A Tabular report format presents data in a simple table format, Just like an excel worksheet. In this format, each row represents a record, and each column represents a field. Tabular reports do not include groupings and hence we cannot create charts for this type of report.
Summary Report	A Summary report in Salesforce organizes data into groups based on chosen field. Summary Report generally uses single field for grouping.
Matrix Report	Matrix reports allow users to group data based on rows and columns, providing a summarized view of data across two dimensions. They display data in a grid-like format, with rows representing one grouping and columns representing another with sub totals and grand totals.
Joined Report	Joined reports allow users to create reports that combine data from multiple report blocks, each based on different report types.

What is a Dashboard?

A dashboard is a visual representation of data, generally created from the reports to analyze, monitor and track the performance of various indicators relevant to organization's objectives.

Building Blocks of a Dashboard

1. **Report Data:** Salesforce dashboards are populated with data from underlying reports. Users can select one or more reports to serve as the data source for each dashboard component.
2. **Dashboard Filters:** These are filters applied at the dashboard level that affect all dashboard components.
3. **Refresh Controls:** Dashboard refresh controls allow users to manually refresh the data displayed on the dashboard to ensure it reflects the most up-to-date information.
4. **Component Layout:** Users can arrange and customize the layout of dashboard components within the dashboard canvas. A dashboard canvas can have maximum 20 components in it.

Dynamic Dashboard

A dynamic dashboard in Salesforce is a type of dashboard that provides personalized, real-time data to users based on their security settings, permissions, and other criteria. Unlike static dashboards, which display fixed data for all users, dynamic dashboards adapt to the individual user's context, displaying information relevant to their role.

Dynamic Dashboard Limit

The number of dynamic dashboards we can create depends on the Salesforce Org edition

- Enterprise Edition: 5 dynamic dashboards
- Performance and Unlimited Edition: 10 dynamic dashboards
- Developer Edition: 3 dynamic dashboards

Define Custom Report Type

A custom report type defines the relationships between different standard or custom Salesforce objects, allowing users to create reports that span across multiple objects and access related data in a single report.

A custom report type is useful when we have to create report having multiple objects but do not have a standard report type for that.

Benefits of a Custom Report Type:

- 1. Define Relationships:** Custom report types allow Salesforce administrators to define relationships between a primary object and related objects. For example, we can create a custom report type that links Candidates with related Job Applications with associated Offers.
- 2. Select Fields:** Once the relationships are established, administrators can select which fields from each related object that should be available for reporting.

With & With or Without

When creating custom report types, there are **two** options to specify how the objects are related to each other.

With Option: This means that the report will only include records from the primary object that have at least one related record in the secondary object. Example: Candidates with Job Applications will only show Candidates that have at least one related Job Application.

Step 2. Define Report Records Set

This report type will generate reports about Candidates. You may define which related records from other objects are returned in report results by choosing a relationship to another object.

A Candidates
Primary Object

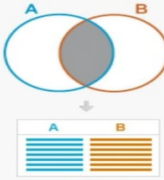

B Job Applications

A to B Relationship:

☒ Each "A" record must have at least one related "B" record.
☐ "A" records may or may not have related "B" records.

(Click to relate another object)

With Option

Add Child Objects to a Custom Report Type

- A Custom Report Type has one Primary Object.
- Three Child Objects can be added further in a Report Type.
- A Custom Report Type can have up to 3 objects.

Object Relationships Edit Object Relationships Help ?

Candidates (A)

- with at least one related record from **Job Applications (B)**
- with at least one related record from **Offers (C)**
